

EMQ X Cloud Webinar

# Ensure MQTT Security with TLS/SSL in EMQ X Hands-on Tutorial

February 9th

9:00am EST / 3:00pm CET / 2:00pm UTC

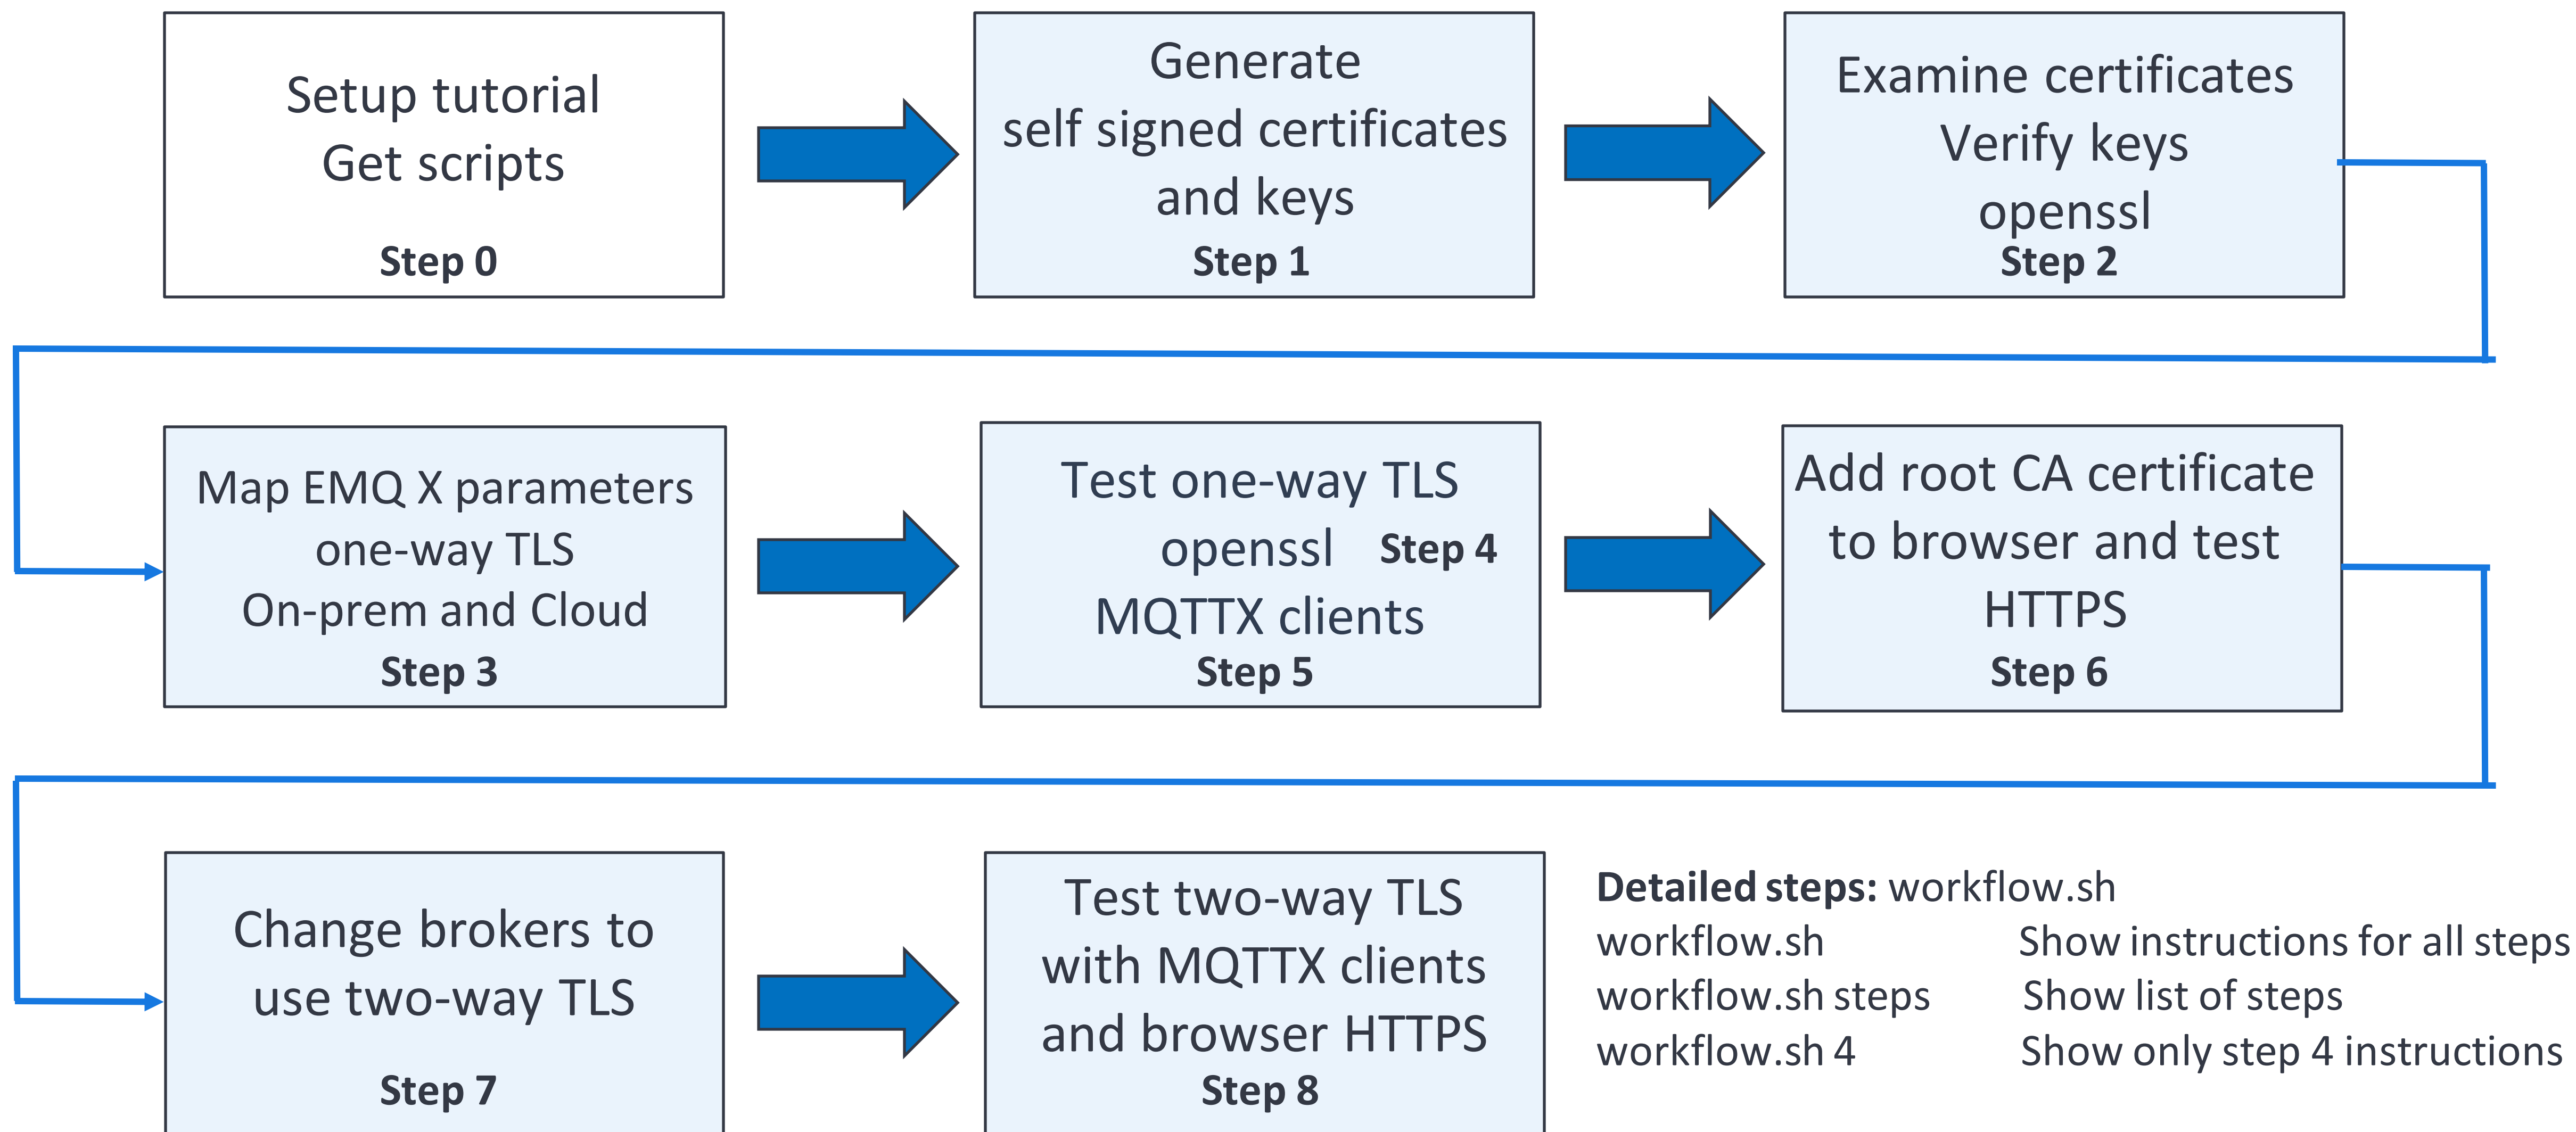

Speaker:

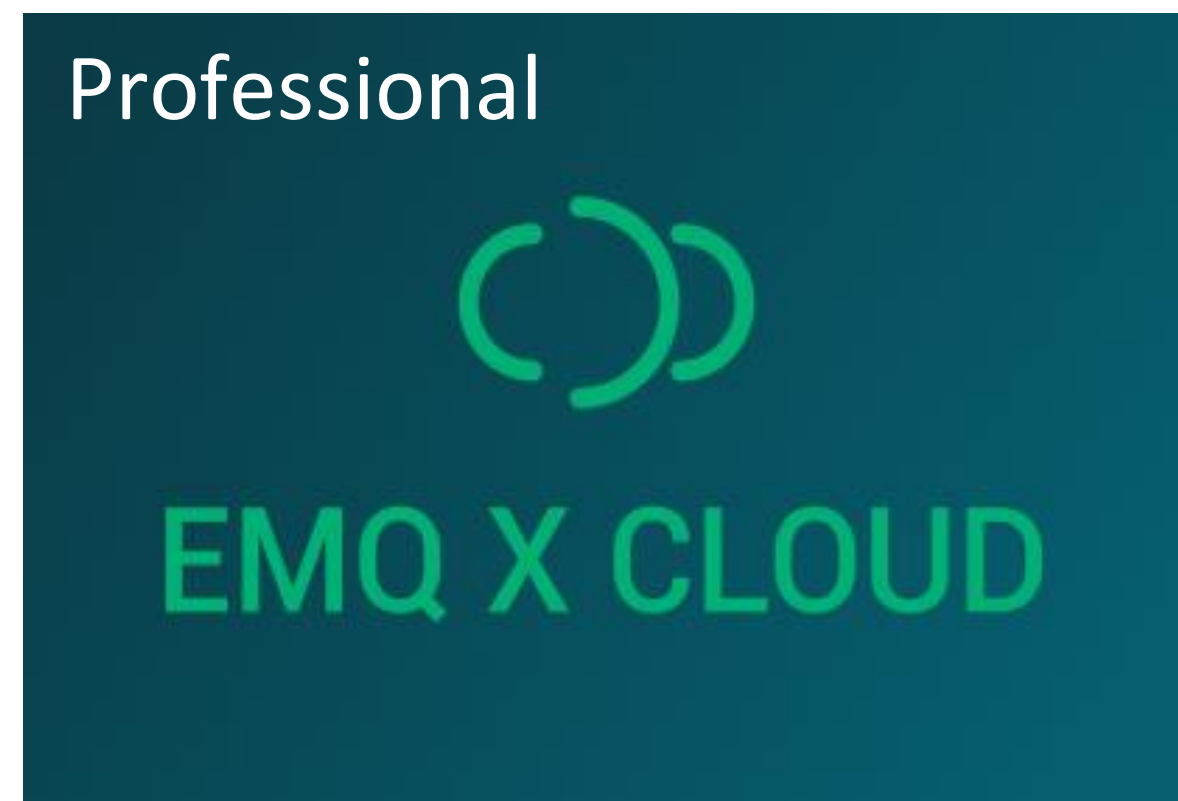

Kary Ware, Sales Engineer @EMQ

# Tutorial Workflow

# Step 0 – Tutorial setup overview

Docker Ubuntu image  
+  
EMQ X Ubuntu install

≠

## Available Downloads

Version  
v4.4.0

OS  
Ubuntu / Ubuntu 20.04

## Available Downloads

Version  
v4.4.0

OS  
Docker

EMQ X Docker Install

Alpine Linux  
Smaller

Windows Laptop PC

Docker  
Ubuntu 20.04  
EMQ X Enterprise

 **MQTT X**  
MQTT Clients

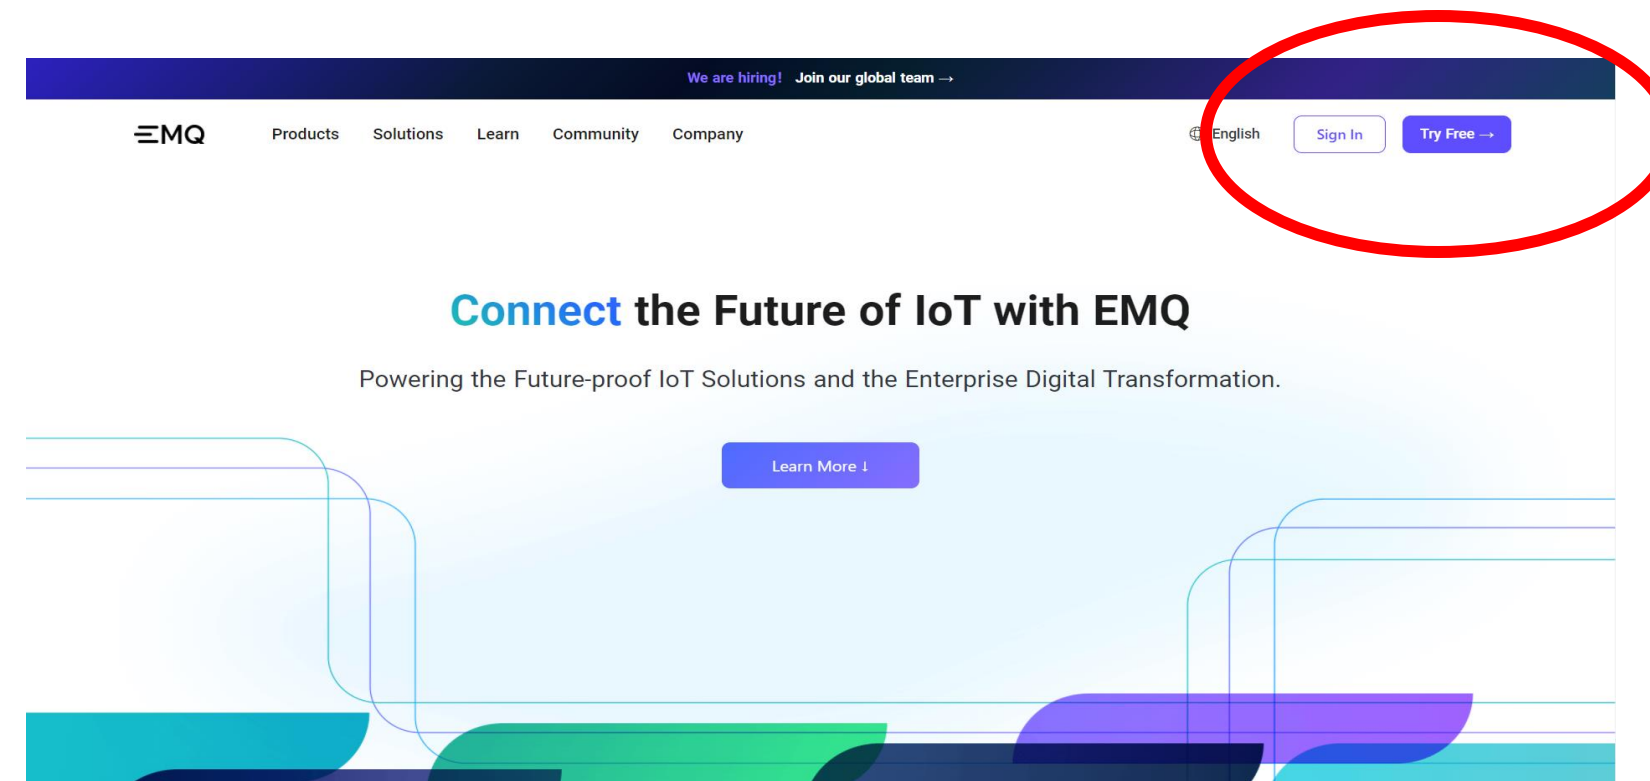

You can also install EMQ X directly on Linux

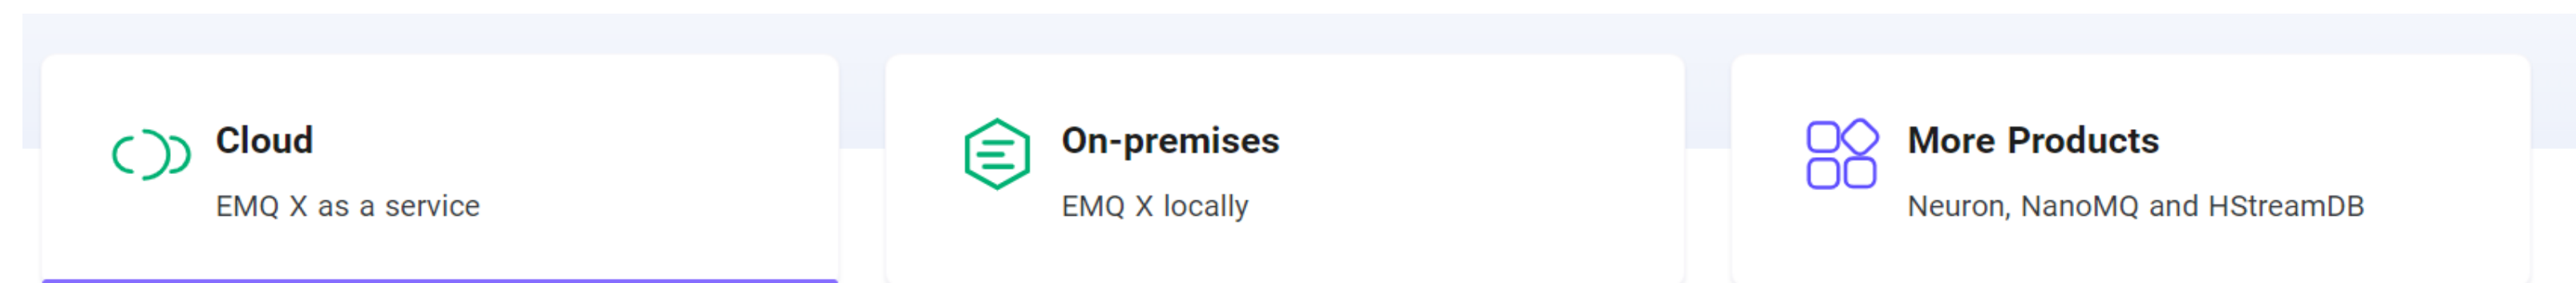

# Get a free trial

Go to [www.emqx.com](http://www.emqx.com)  
and click **Try Free**

Choose **Cloud** or On-Premises

Follow the instructions

You don't need a credit card!

# Downloads

---

## To match the setup in the tutorial

Download docker ubuntu 20.04 image

[https://hub.docker.com/\\_/ubuntu](https://hub.docker.com/_/ubuntu)

---

## Install EMQ X on-prem and cloud & MQTT X

Install EMQ X Enterprise Ubuntu 20.04

[www.emqx.com/en/try?product=enterprise](http://www.emqx.com/en/try?product=enterprise)

EMQ X Cloud free trial

<https://www.emqx.com/en/try?product=cloud>

Install MQTT X

<https://mqttx.app/>

---

## Download tutorial scripts

Download certificate generating scripts and put them in:

[emqx/etc/certs2](#)

<https://github.com/emqx/emqx-webinars/tree/main/2022-02-09-emqx-tls/scripts>

# Step 1 - Generate self-signed certificates and keys

These are the scripts used to generate the certificates.  
**generate-certs.sh** is the main file that calls the others.

```
generate-certs.sh
00-generate-root-ca.sh
01-issue-inter-ca.sh (x2)
02-issue-server-cert.sh
03-issue-client-cert.sh
```

In the demo, generate-certs.sh is run **twice**  
 Once to generate **local** certificates, and once for **cloud**

The scripts read from environment variables to set the certificate information.

The certificate files are put into separate directories.

## local

```
export TLS_CLIENT_COMMON_NAME="172.17.0.1"
export TLS_SERVER_DNS=localhost
```

```
ca.pem client-fullchain.pem client.key client.pem
server-fullchain.pem server.key server.pem
```

## cloud

```
export TLS_CLIENT_COMMON_NAME="82.181.15.24"
export TLS_SERVER_DNS=s1.....amazonaws.com
```

```
ca.pem client-fullchain.pem client.key client.pem
server-fullchain.pem server.key server.pem
```

The demo uses a helper script to set the environment variables

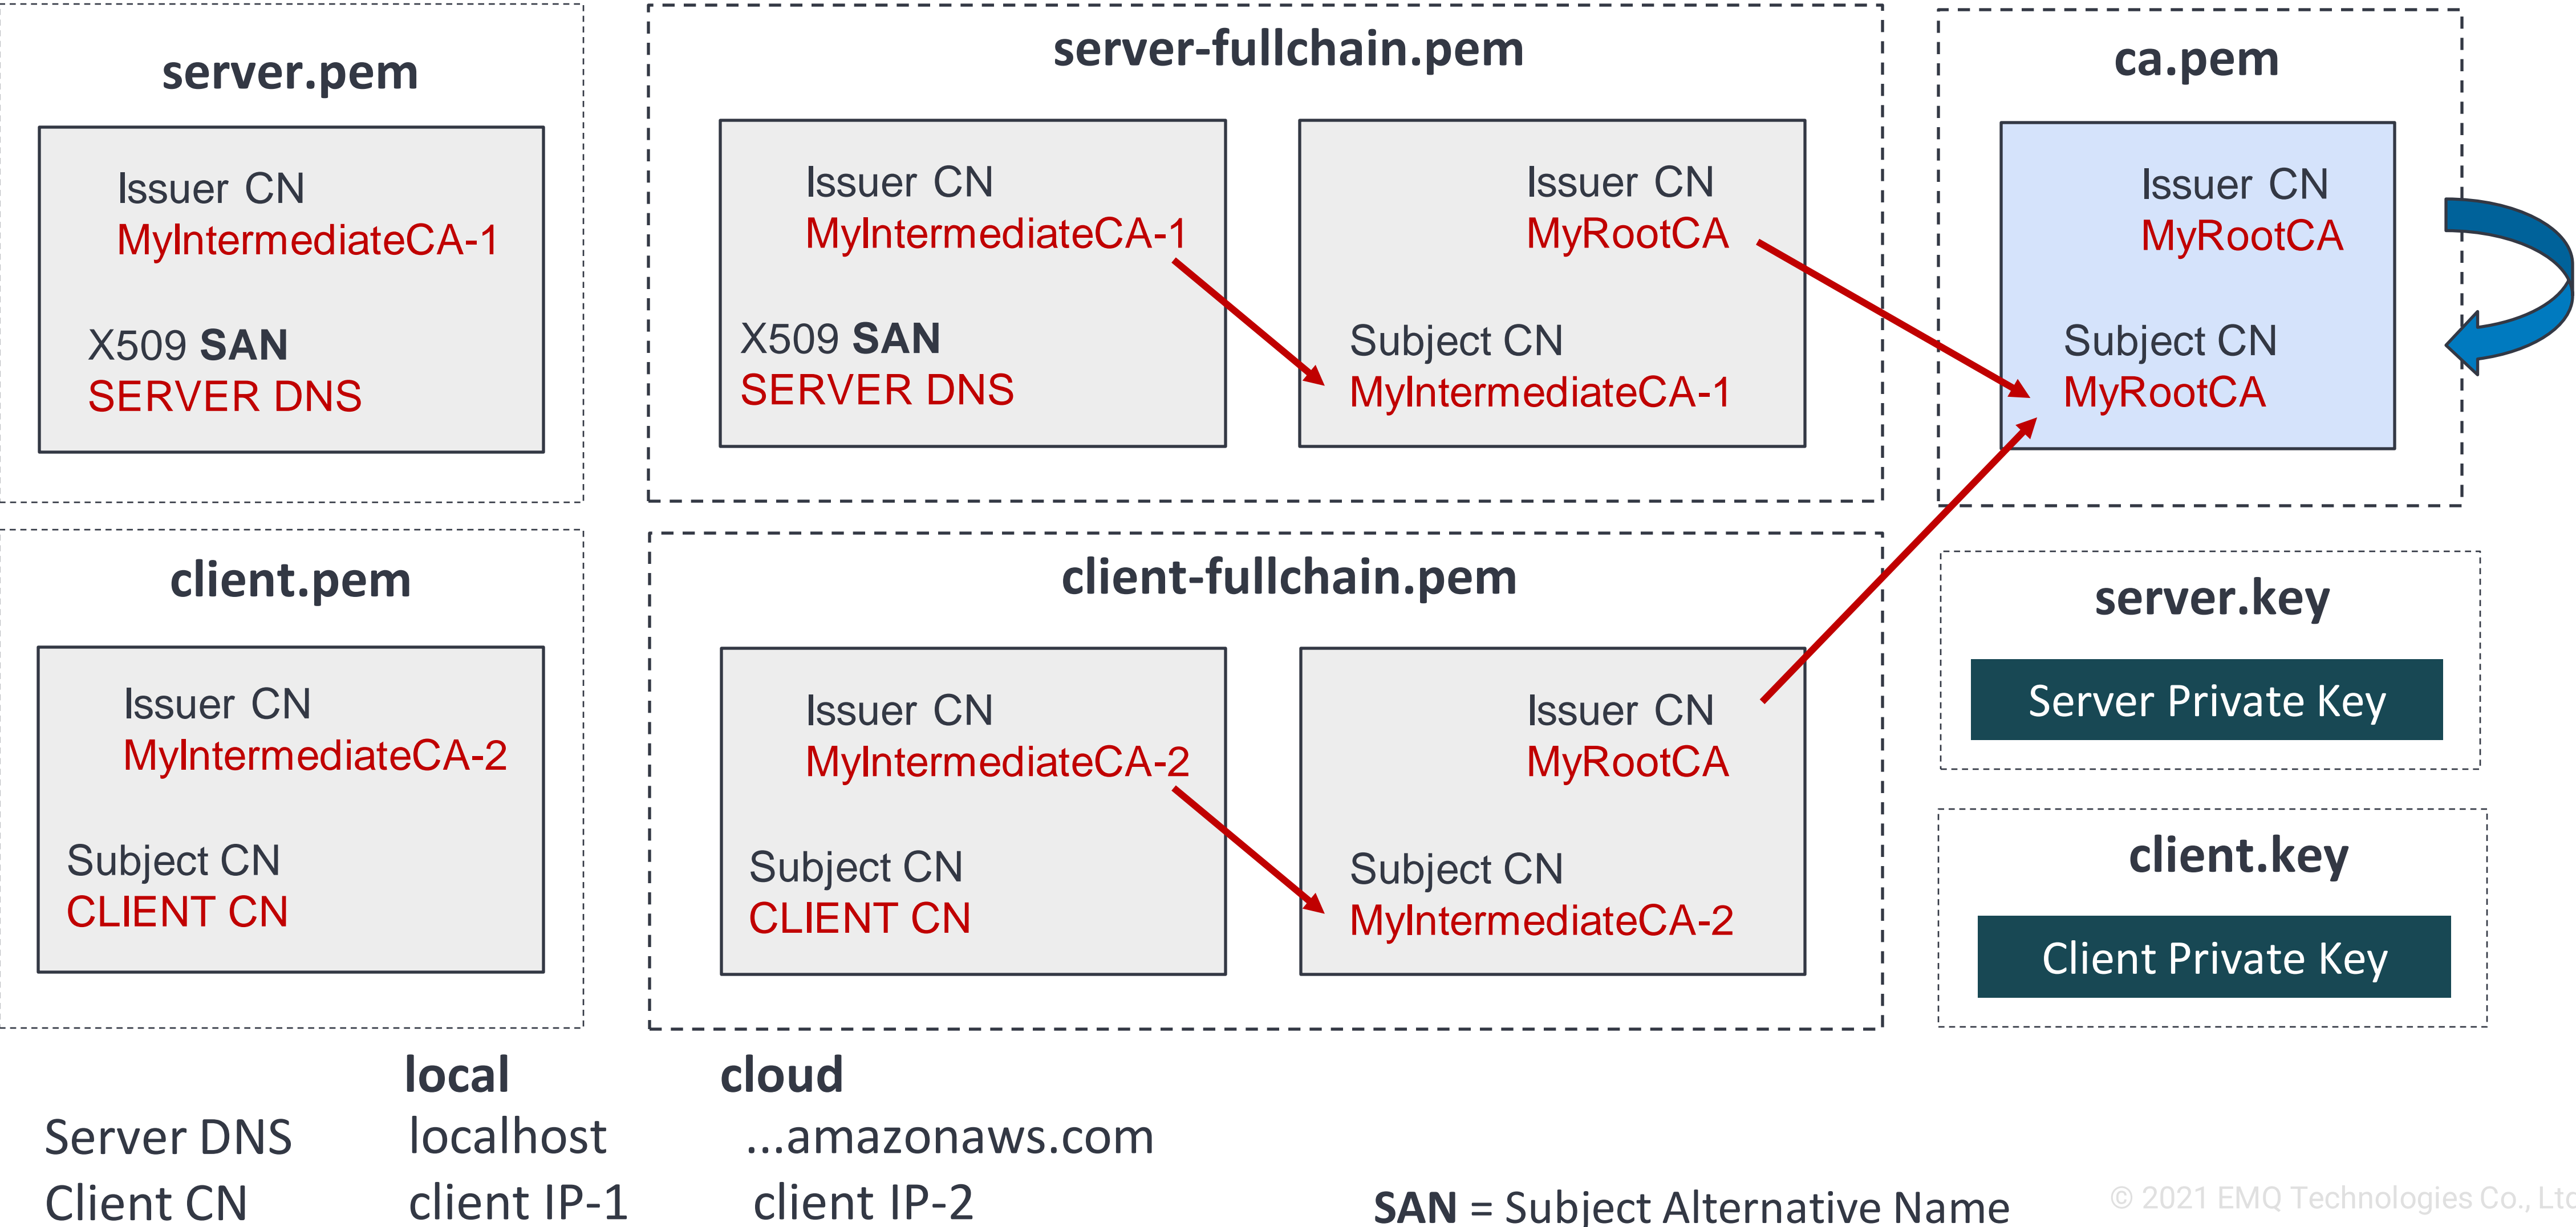

```
source env-config.sh
```

```
source env-config.sh cloud
```

Note: The TLS\_SERVER\_DNS is put in the X509 extensions Subject Alternate Name and not the subject name

# Generated certificate files

`generate-certs.sh` will generate the following certification files: **local** and **cloud**

## Step 2 - Examine certificates and verify keys

These scripts can be used to view and verify the files

```
show.sh  trace.sh  cacerts_show.sh  
verify.sh  key-cert-verify.sh
```

Examine the root CA file and verify that EMQ X does not contain MyRootCA

```
../trace.sh ca.pem  
../cacerts_show.sh | grep "MyRootCA"
```

Verify the subject, issuer chain is correct including the X509 extensions

```
../trace.sh server-fullchain.pem  
../show.sh server-fullchain.pem | grep -iA 4 X509 --color
```

Verify the dates are valid

```
../show.sh server-fullchain.pem | grep -iA 4 X509 --color
```

Verify the keys are valid

```
../verify.sh server
```

# Step 3 - Map EMQ X parameters for one-way TLS

## On-prem

Edit the **listeners.conf** file  
for **SSL and WSS**

\*.verify = **verify\_none** means the  
broker will use one-way TLS

```
listeners.ssl.external.keyfile = /opt/emqx/etc/certs2/local/server.key  
listeners.ssl.external.certfile = /opt/emqx/etc/certs2/local/server-fullchain.pem  
listeners.ssl.external.verify = verify_none
```

```
listeners.wss.external.keyfile = /opt/emqx/etc/certs2/local/server.key  
listeners.wss.external.certfile = /opt/emqx/etc/certs2/local/server-fullchain.pem  
listeners.wss.external.verify = verify_none
```

Edit the  
plugins/**emqx\_dashboard.conf** file  
for **HTTPS**

```
dashboard.listener.https.keyfile = /opt/emqx/etc/certs2/local/server.key  
dashboard.listener.https.certfile = /opt/emqx/etc/certs2/local/server-fullchain.pem  
dashboard.listener.https.verify = verify_none
```

The broker will automatically update the configuration in a few minutes.

You do not need to restart the broker, but you can restart the broker if you want it to update immediately.

```
emqx/bin/emq stop  
emqx/bin/emqx start
```

# Map EMQ X parameters or one-way TLS Cloud

Connect Ports: 1883(mqtt), 8083(ws)

TLS/SSL Config ?

The certificate files are mapped in the TLS/SSL Config section as shown.

Make sure to use the certificates in the cloud directory.

Should now see all the ports

Connect Ports: 1883(mqtt), 8883(mqtts), 8083(ws), 8084(wss)

\* TLS/SSL type

one-way

\* Certificate body

1 cloud/server.pem

upload PEM-encoded [See the example](#)

Certificate chain

1 cloud/server-fullchain.pem

upload PEM-encoded [See the example](#)

\* Certificate private key

1 cloud/server.key

upload PEM-encoded [See the example](#)

## Step 4 - Test one-way TLS (using openssl s\_client)

These scripts can be used to test the certificates on the running brokers.

```
sclient-ssl.sh  
sclient-wss.sh  
sclient-https.sh
```

To test **local** certificates  
Run in the **local** directory

```
../sclient-ssl.sh  
../sclient-wss.sh  
../sclient-https.sh
```

To test cloud certificates  
Run in the **cloud** directory and use  
the cloud parameter

```
../sclient-ssl.sh cloud  
../sclient-wss.sh cloud
```

EMQ X Cloud does not use port  
18084 for HTTPS

# Step 5 - Test one-way TLS using MQTTX

Create Local and Cloud collections.

Create four **Local** clients and four **Cloud** clients. One for each connection type

Connect

Connection	Port
<b>mqtt://</b> (TCP)	1883
<b>mqtt://</b> (SSL)	8883
<b>ws://</b>	8083
<b>wss://</b>	8084

Click **Connect** to connect the clients to the broker.

Defaults to EMQ's public broker

\* Host

If client connects, but you don't see it in EMQ X, check that it is connected to the correct broker.

## mqttps (SSL) and WSS

SSL/TLS ☒ true ☐ false

\* Certificate ☐ CA signed server ☒ Self signed

SSL Secure ☒ ⓘ

\* CA File

## mqtt (TCP) and WS

SSL/TLS ☐ true ☒ false

Make sure to use the correct ca.pem file

# MQTTX local client example

Connect

## General

\* Name Local-SSL

\* Client ID Local-SSL

\* Host mqtt:// localhost

Address to local on-prem EMQ X broker

\* Port 8883

Username Local-SSL

Password .....

SSL/TLS ☒ true ☐ false

\* Certificate ☐ CA signed server ☒ Self signed

SSL Secure ☒ ⓘ

## Certificates

\* CA File C:\Demo\TLS\certs2\local\ca.pem

Use the local ca.pem file

Authentication & ACL

Authentication

test1

test1

Use the cloud ca.pem file

# All clients subscribe to testtopic/#

All clients should now be connected and listed in green.

For each client

Click **New Subscription**

Subscribe to the default topic **testtopic** and all subtopics

Each client should now be subscribed to topic **testtopic** and all subtopics

\* Topic

testtopic/#

testtopic/#

QoS 0

# Clients listed in their brokers

## EMQ X Cloud

Client connections and subscriptions

Client ID	Topic
Client ID	Topic
Cloud-TCP	testtopic/#
Cloud-WS	testtopic/#
Cloud-SSL	testtopic/#
Cloud4-WSS	testtopic/#

## EMQ X on-prem

Client connections and subscriptions

Client ID	Topic
Local-WS	testtopic/#
Local-WSS	testtopic/#
Local-TCP	testtopic/#
Local-SSL	testtopic/#

# Publish message

Choose one client in **Local** or **Cloud** group.

Enter Payload message in JSON format.

Click green button to publish message to testtopic/1

Verify all clients **in the group** received the message

Repeat for one client in the other group

To publishing a message

Payload:  QoS:  ☐ Retain ☐ Meta

```
{
  "temperature_c": 25.0,
  "temperature_f": 77.0,
  "level_m": 7.947214,
  "speed_kmh": 158.9443
}
```

Received message is shown to the right of the selected client

▼ Local

- Local-SSL@localhost:... SSL
- Local-WSS@localhost... 1 SSL
- Local-TCP@localhost... 1
- Local-WS@localhost... 1

▼ Cloud

- Cloud-SSL@s1ca4a52... SSL
- Cloud-WSS@s1ca4a5... SSL
- Cloud-TCP@s1ca4a52...
- Cloud-WS@s1ca4a52...

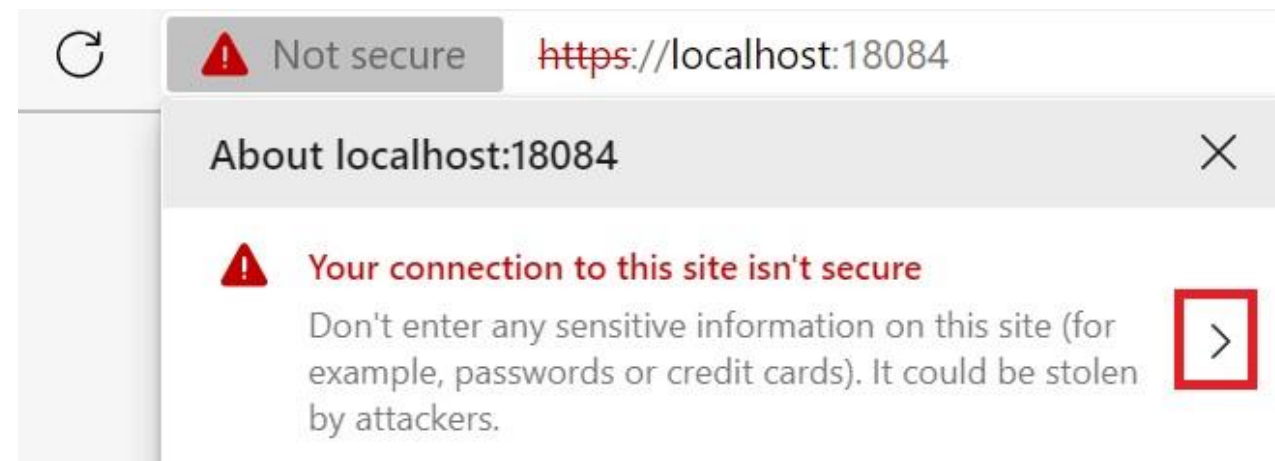

Topic: testtopic/1 QoS: 0

```
{
  "temperature_c": 25.0,
  "temperature_f": 77.0,
  "level_m": 7.947214,
  "speed_kmh": 158.9443
}
```

# Step 6 - Add server root certificate to browser

Browser: <https://localhost:18084>

Click **Not Secure**

Click **Certification Path**

Select MyIntermediateCA-a

Click **View Certificate**

Edge

Chrome: Certificate is not valid

Problem is that browser does not have MyRootCA

**Issued to:** MyIntermediateCA-1

**Issued by:** MyRootCA

**Valid from** 2022-01-22 **to** 2032-01-20

Next step is to add the MyRootCA as a trusted certificate...

# Add MyRoocCA certificate to Trusted Root CAs

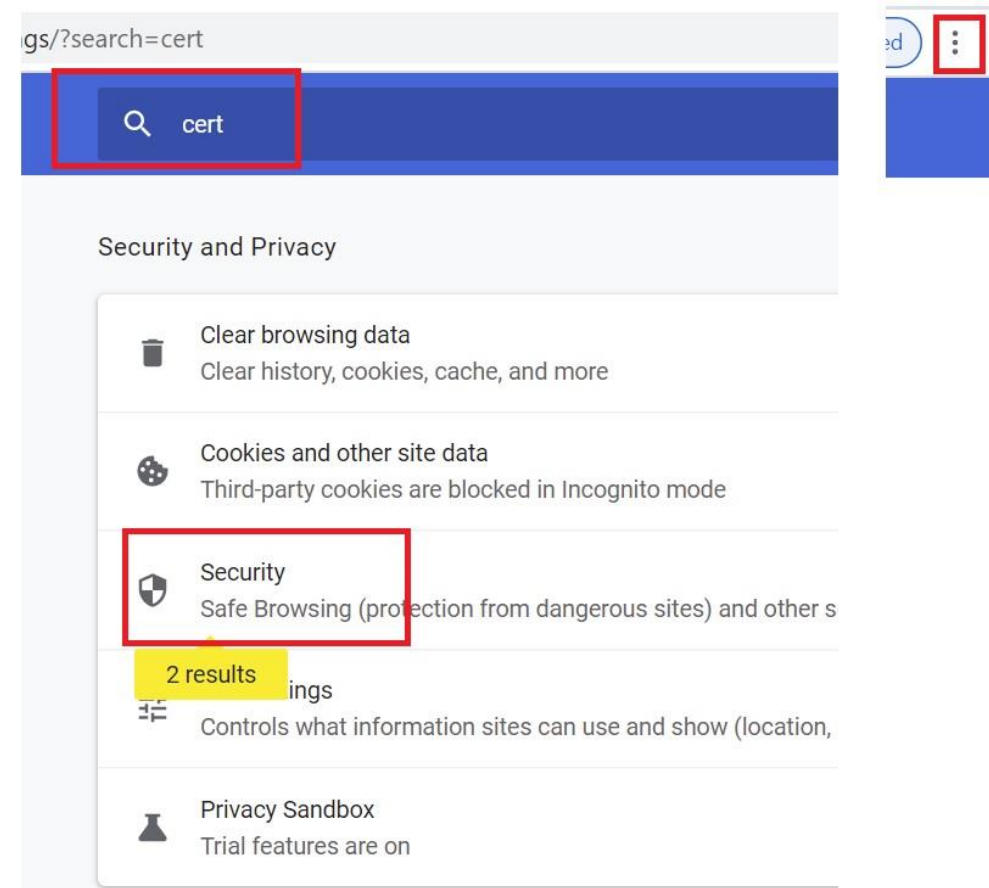

## Chrome

Click three dots

Search "cert"

Click **Security**

Scroll down and click **Manage Certificates**

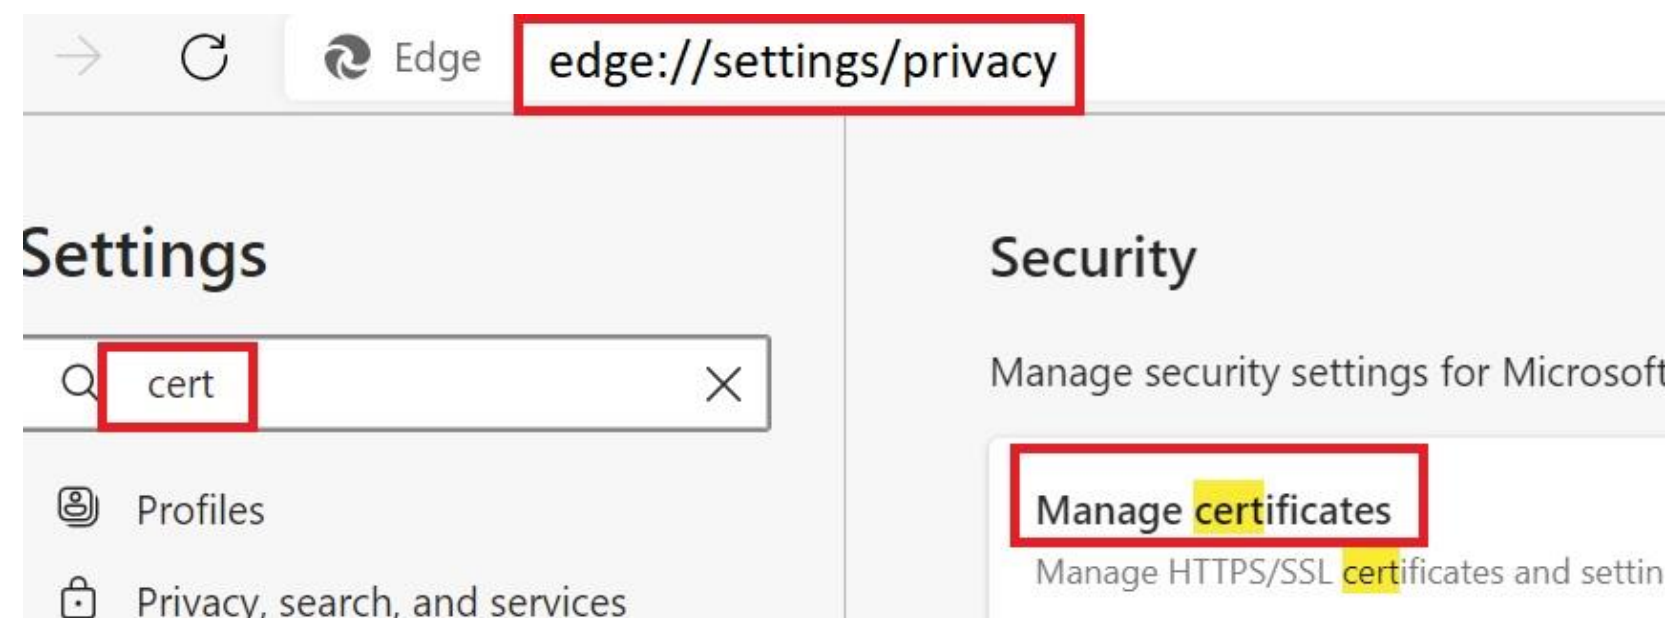

## Edge

Address: edge://settings/privacy

Search "cert"

Click **Manage certificates**

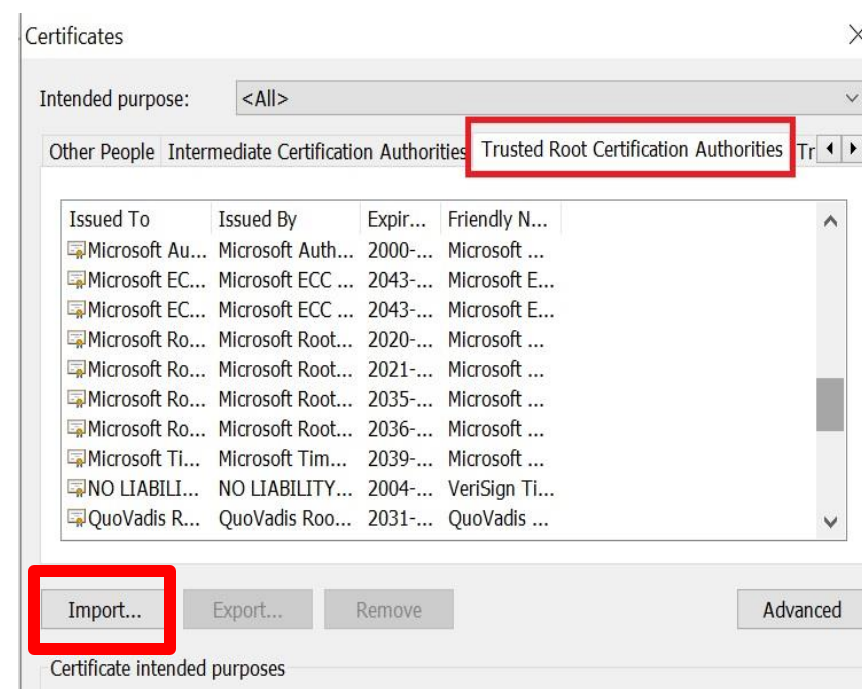

Scroll down and click **Manage Certificates**

Both browser will bring you to this dialog box

Manage certificates

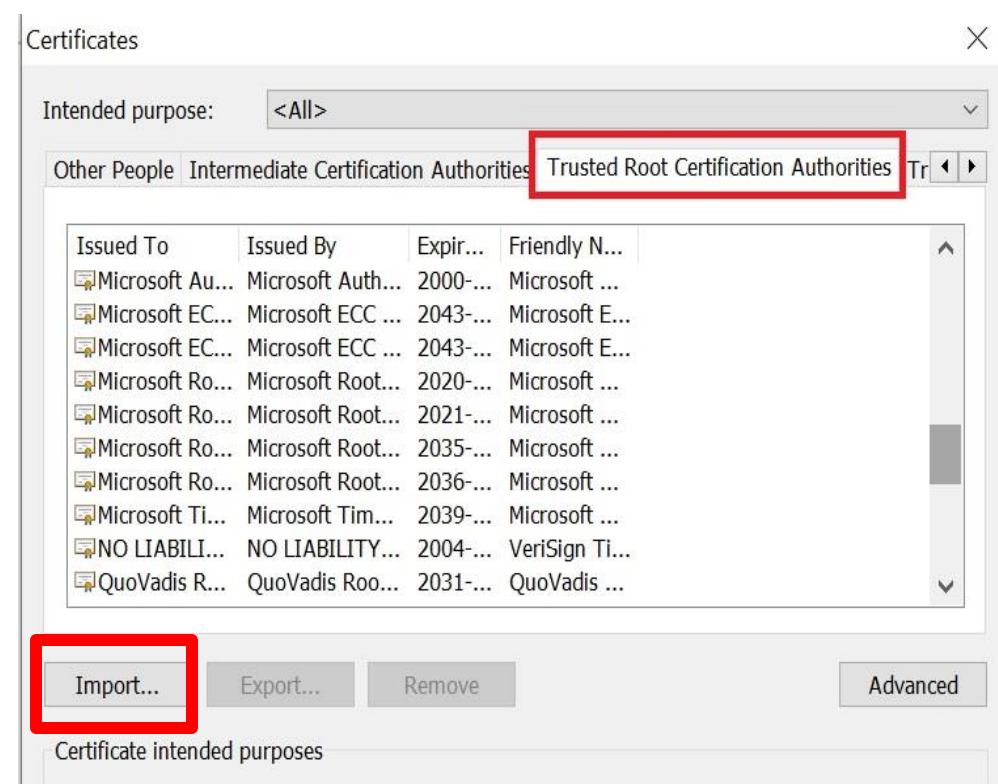

Manage HTTPS/SSL certificates and settings

Continued...

# Add certificate to Trust CA and test HTTPS

Restart browser

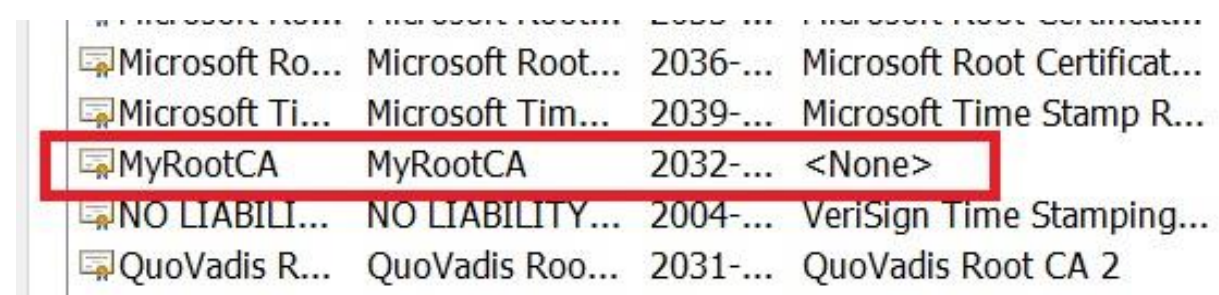

Brows to <https://localhost:18084>

Verify lock symbol is shown

Click **Trusted Root Certificate Authorities**

Verify MyRootCA not included (delete it if it is)

Select Import

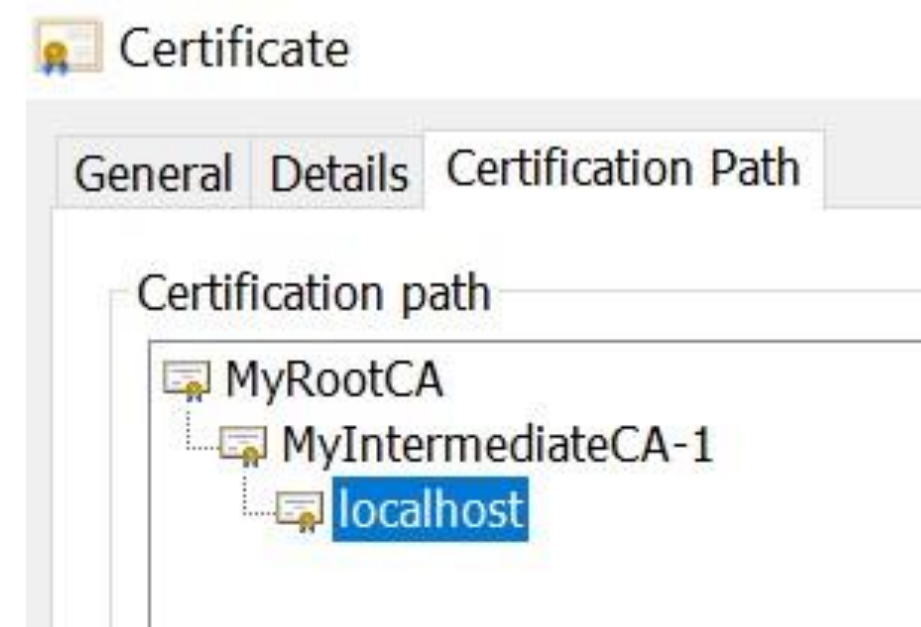

Browse to **local/ca.pem**

May need to set to **All Files**

Verify Certificate Path now includes

MyRootCA and that the certificate is valid

Certificate status:

This certificate is OK.

# Step 7 - Change brokers to use two-way TLS

## EMQ X on-prem

Change `verify_none` to `verify_peer`

This forces two-way TLS

## listeners.conf

```
listener.ssl.external.cacertfile = /opt/emqx/etc/certs2/local/ca.pem
listener.ssl.external.verify = verify_peer
listener.ssl.external.fail_if_no_peer_cert = true

listener.wss.external.cacertfile = /opt/emqx/etc/certs2/local/ca.pem
listener.wss.external.verify = verify_peer
listener.wss.external.fail_if_no_peer_cert = true
```

Client root CA file  
needed for two-way TLS

## EMQ X Cloud

\* TLS/SSL type

two-way

\* Certificate body

cloud/server.pem

upload PEM-encoded [See the example](#)

Certificate chain

cloud/server-fullchain.pem

upload PEM-encoded [See the example](#)

\* Certificate private key

cloud/server.key

upload PEM-encoded [See the example](#)

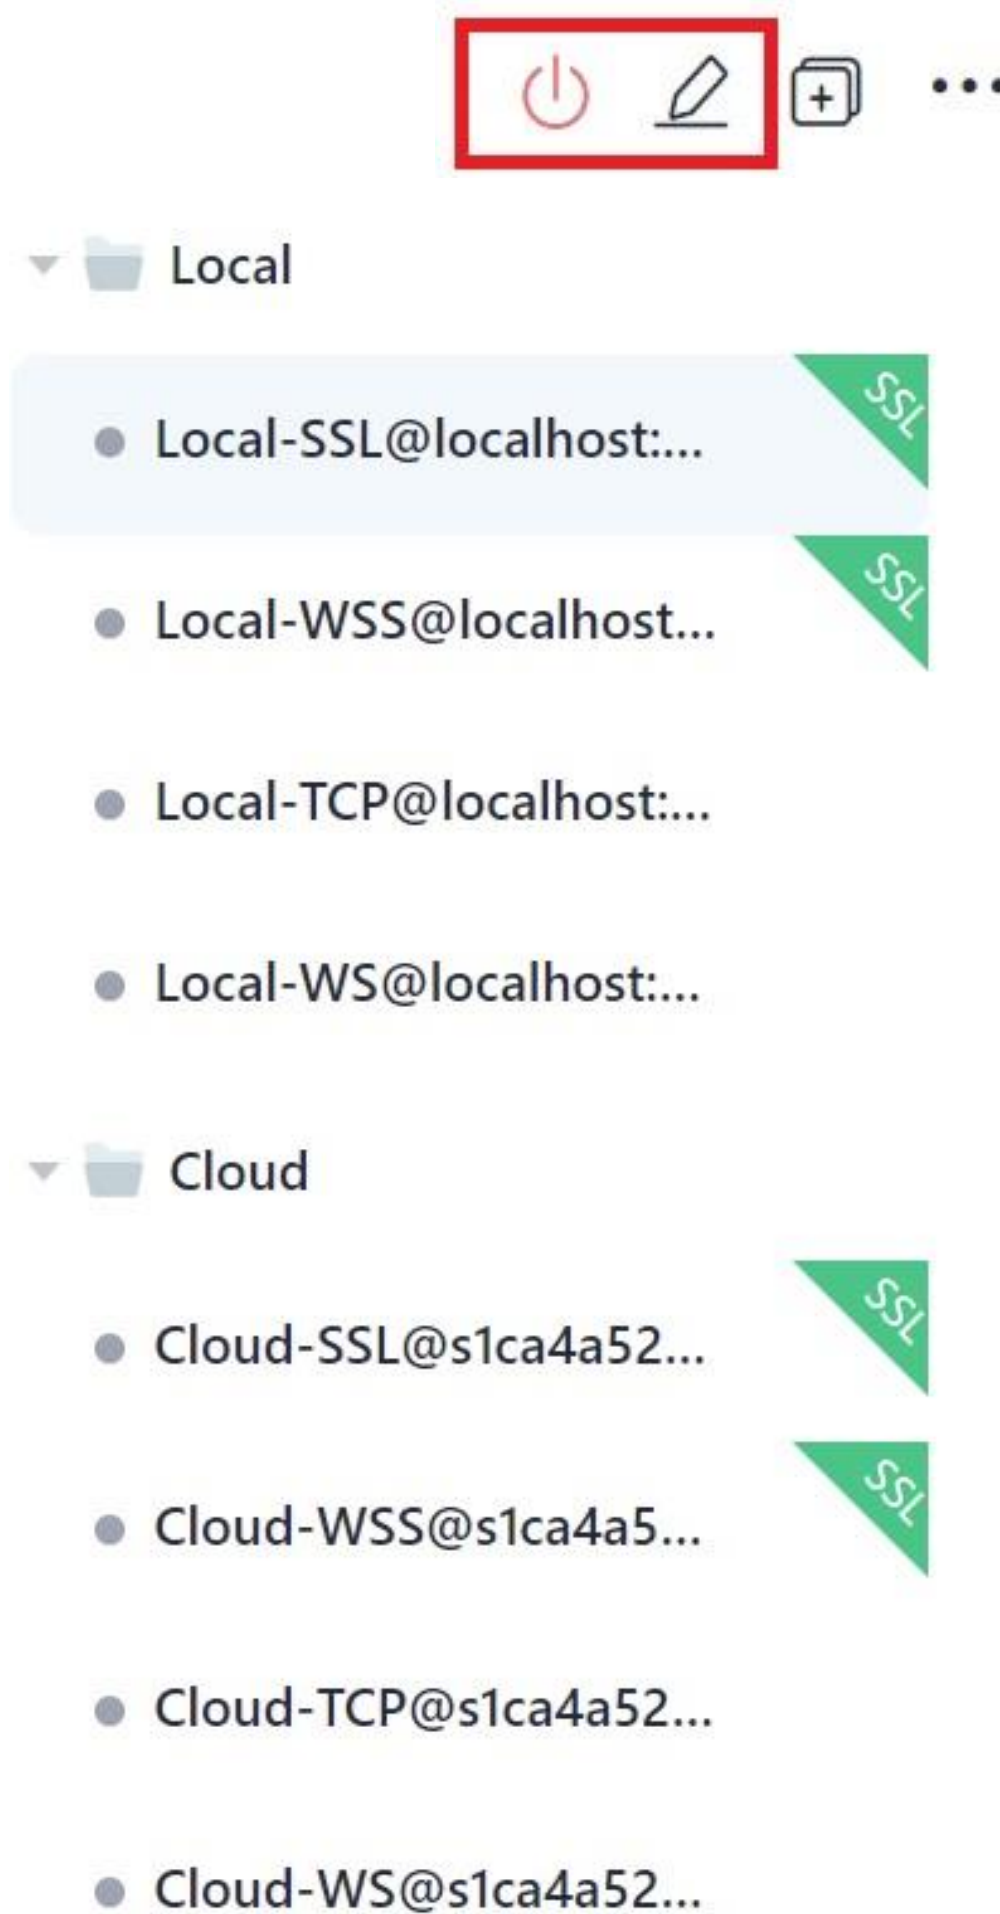

\* Client CA certificate

cloud/ca.pem

upload PEM-encoded [See the example](#)

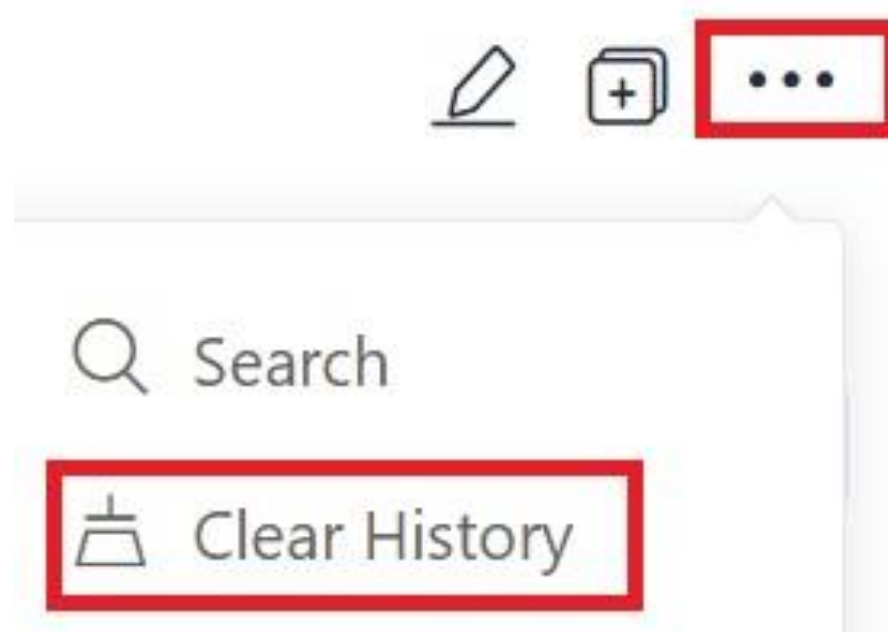

# Step 8 - Test two-way TLS with MQTTX

Disconnect all the clients

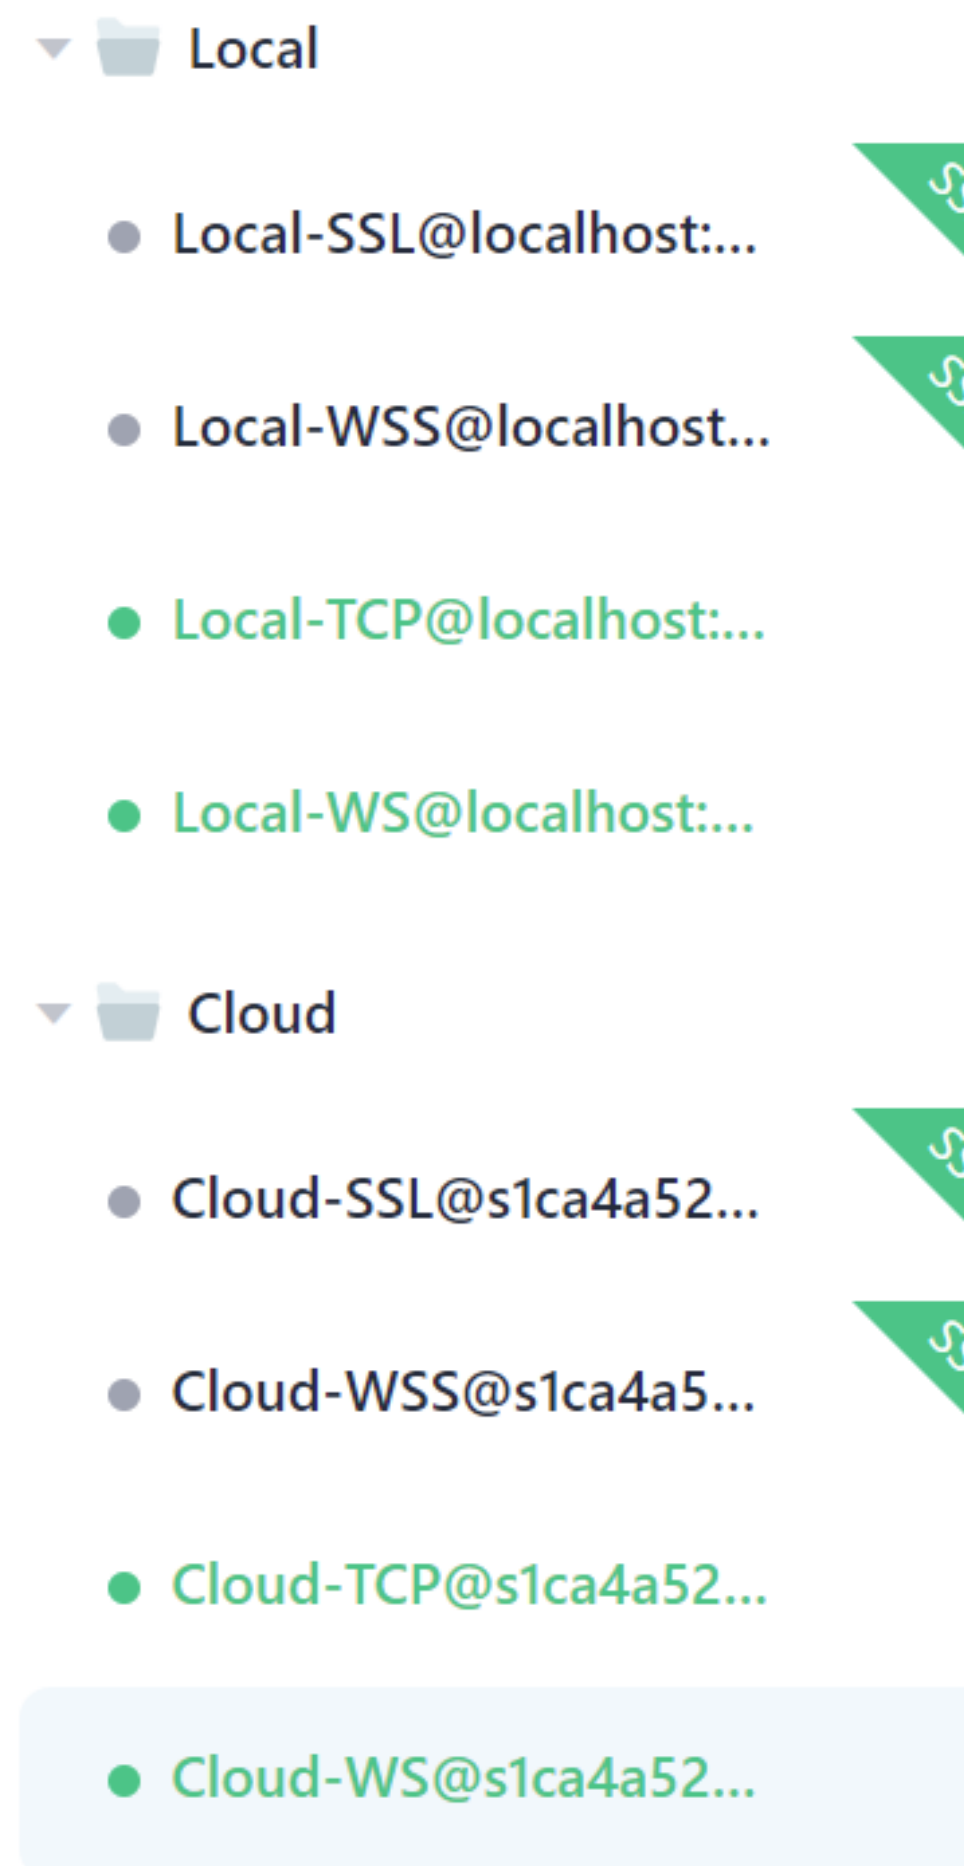

Disconnect and edit buttons

Can use Clear History to clear old messages

The TLS clients cannot connect

# Need to add client certificate files

## For two-way TLS

Need to add client-full-chain.pem and client.key files for the SSL clients

* CA File	C:\Demo\TLS\certs2\local\ca.pem
Client Certificate File	client-fullchain.pem
Client key file	client.key

Make sure to use the correct **local** or **cloud** directory

Connect

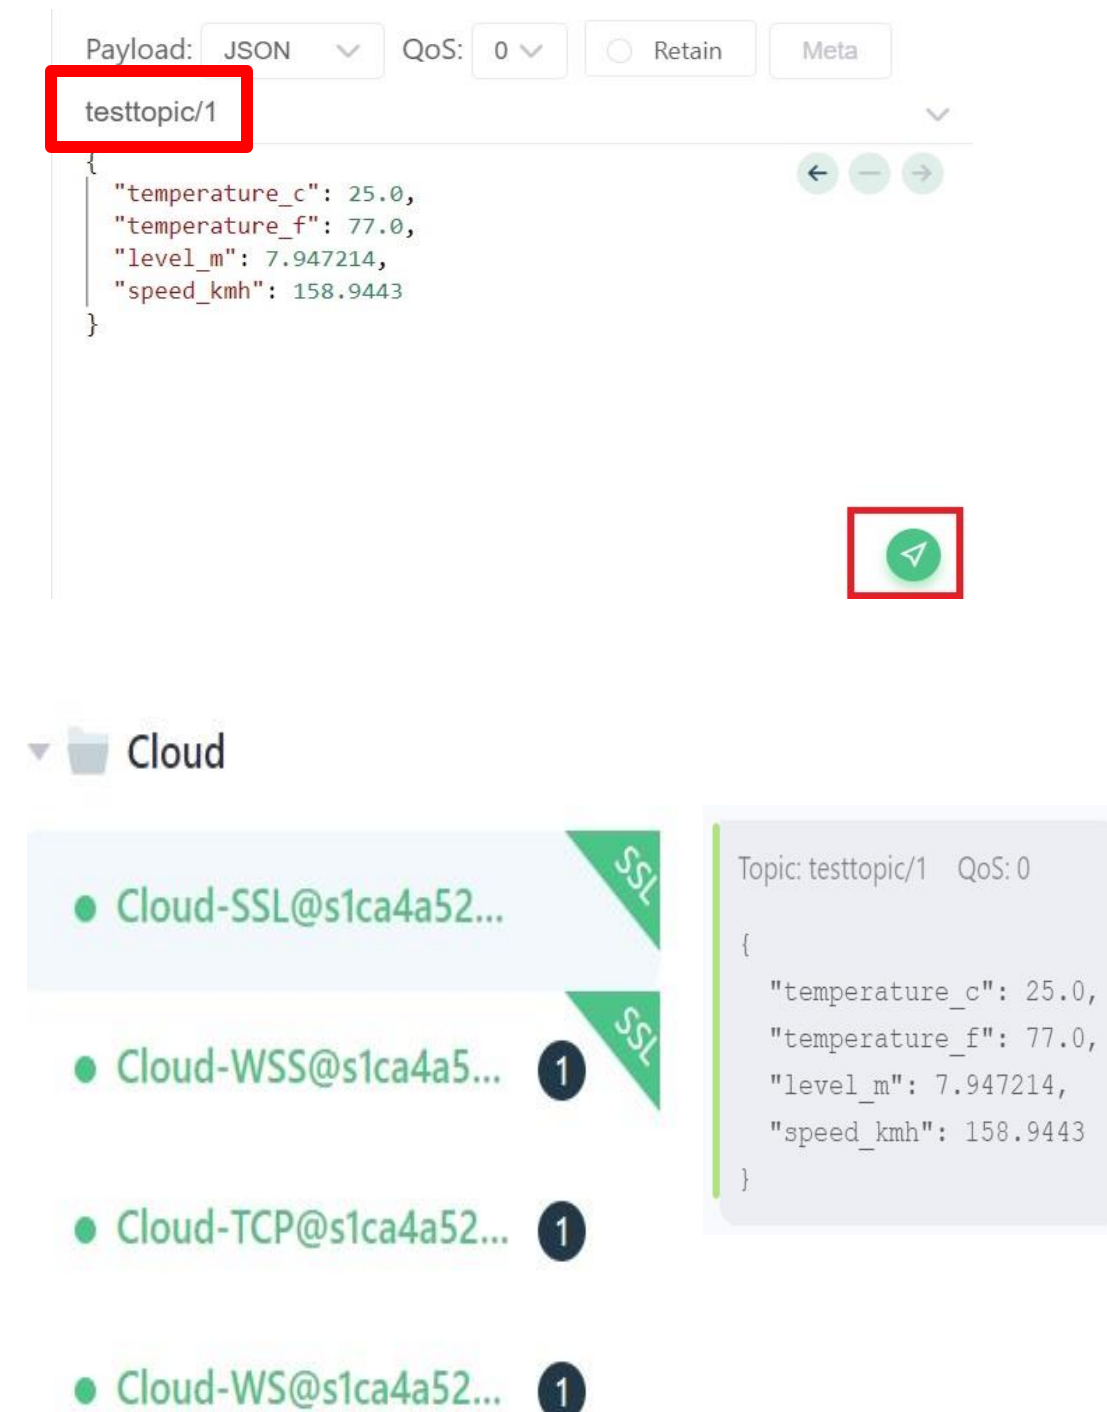

Click Connect to reconnect the clients.

**Note:** MQTTX will automatically subscribe clients to their subscribed topics

All clients should now be connected and listed in green.

Publish message as before and verify that the message has been received correctly.

# Test two-way HTTPS with browser

For Windows

Need to add client-fullchain certificate

But need to convert it to pfx format since it contains multiple certificates

Script **convertClientToPxf.bat**

```
openssl pkcs12 -export -keypbe NONE -certpbe NONE -in client-fullchain.pem -inkey client.key -out client-fullchain.pfx
```

Follow the previous steps to add the client-fullchain.pfx file to the **Personal** certificates

File name:

C:\Demo\TLS\certs2\local\client-fullchain.pfx

Browse...

Note: More than one certificate can be stored in a single file in the following formats:

Personal Information Exchange- PKCS #12 (.PFX,.P12)

Cryptographic Message Syntax Standard- PKCS #7 Certificates (.P7B)

Microsoft Serialized Certificate Store (.SST)

Browser will ask you to choose the client certificate
